1 Topological Sort

We can get topological ordering of a DAG using DFS or BFS.

Algorithm 1 DFS for topological sort

```
1: procedure DFS-LOOP(Graph  $G$ )
2:   mark all nodes unexplored
3:   current_label  $\leftarrow n$  ▷ To keep track of ordering
4:   for each vertex  $v \in G$  do
5:     if  $v$  is not explored then ▷ in some previous DFS call
6:       DFS( $G, v$ )
7:
8: procedure DFS(Graph  $G$ , Start vertex  $s$ )
9:   mark  $s$  explored
10:  for every edge  $(s, v)$  do
11:    if  $v$  not yet explored then
12:      DFS( $G, v$ )
13:  set  $f(s) = \text{current\_label}$ 
14:  current_label--
```

Algorithm 2 BFS for topological sort

```
1: procedure BFS(Graph  $G$ )
2:   counter  $\leftarrow 0$ 
3:   create a queue  $box$ 
4:   for each vertex  $v \in G$  do
5:     if the indegree of  $v == 0$  then
6:       put  $v$  into the  $box$ 
7:   while  $box$  is not empty do
8:     pop a vertex  $v$  out of  $box$ 
9:     increment counter
10:    set  $f(v) = \text{counter}$ 
11:    for each  $(u, v)$  do
12:      decrement the indegree of  $u$ 
13:      if the indegree of  $u == 0$  then
14:        put  $u$  into the  $box$ 
15:  if counter  $\neq$  number of vertices in  $G$  then
16:    exception(the graph has cycle)
```
